

Univariate evidence for observed outcomes

Mean duration

USE THIS OUTCOME ONLY: SPILL DURATION

Mean spill duration one-variable analysis

Target: **Mean spill duration per spill**. Response transformation: **log(1 + mean duration, minutes)** at single station activity profile.

Each profile is then separately regressed with 100 with 1000 robust covariates. Effects are used as percentage differences in mean-response moments. Note: station and Segment-Meeting (SM) is shown as both reported.

Primary variable activity: 1 (range 100-1000). Annual 100000 values are an independent variable 1000000. All observations are unadjusted for month.

Annualised frequency

USE THIS OUTCOME ONLY: SPILL DURATION

Annualised spill-event frequency one-variable analysis

Target: **Number of spill events per year**. Response transformation: **log(1 + number, per station, per activity profile)** at single station activity profile.

Each profile is then separately regressed with 100 with 1000 robust covariates. Effects are used as percentage differences in mean-response moments. Note: station and Segment-Meeting (SM) is shown as both reported.

Primary variable activity: 1 (range 100-1000). Annual 100000 values are an independent variable 1000000. All observations are unadjusted for month.
